Washington, D.C. 20231DOCKET NUMBER: AUS990891US1
March 27, 2000

Sir:

Transmitted herewith for filing is the Patent Application of:

Inventor(s): **Rabindranath Dutta, and Kamal Chandrakant Patel**For: **DETECTING COPYRIGHT VIOLATION VIA STREAMED EXTRACTION AND SIGNATURE ANALYSIS IN A METHOD, SYSTEM AND PROGRAM**

Enclosed are:

☒ Patent Specification and Declaration☒ 5 sheets of drawing(s).☒ An assignment of the invention to International Business Machines Corporation (includes Recordation Form Cover Sheet)☐ A certified copy of a application.☐ Information Disclosure Statement, PTO 1449 and copies of references.jc678 U.S. PTO
09/535581
03/27/00

The filing fee has been calculated as shown below:

For	Number Filed	Number Extra	Rate	Fee
Basic Fee				\$ 690.00
Total Claims	23 - 20	3	x 18 =	\$ 54.00
Indep. Claims	4 - 3	1	x 78 =	\$ 78.00
MULTIPLE DEPENDENT CLAIM PRESENTED			x 260 =	\$
TOTAL				\$ 822.00

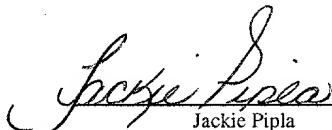

☒ Please charge IBM Corporation Deposit Account No. 09-0447 in the amount of \$ 822.00. A duplicate copy of this sheet is enclosed.☒ The Commissioner is hereby authorized to charge payment of the following fees associated with this communication or credit any overpayment to IBM Corporation Deposit Account 09-0447. A duplicate copy of this sheet is enclosed.☒ Any additional filing fees required under 37 CFR §1.16.☒ Any patent application processing fees under 37 CFR §1.17.

CERTIFICATE OF MAILING BY "EXPRESS MAIL" UNDER 37 CFR § 1.10

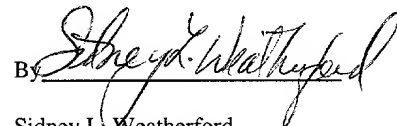

"Express Mail" mailing label number: EL139165860US

Date of Mailing: March 27, 2000

I hereby certify that the documents indicated above are being deposited with the United States Postal Service under 37 CFR 1.10 on the date indicated above and are addressed to Box Patent Applications, Assistant Commissioner for Patents, Washington, D.C. 20231 and mailed on the above Date of Mailing with the above "Express Mail" mailing label number.

 Jackie Pipla

**DETECTING COPYRIGHT VIOLATION VIA STREAMED EXTRACTION AND
SIGNATURE ANALYSIS IN A METHOD, SYSTEM AND PROGRAM**

BACKGROUND OF THE INVENTION

1. Technical Field:

The present invention generally relates to copyright material and in particular to discovering copyright infringement on a network, including the Internet. Still more particularly, the present invention relates to discovering copyright infringement without infringing on copyright material.

2. Description of the Related Art:

Copyright infringement is a major problem on the Internet (Web). Digital documents like Web pages, MP3 audio, etc. are very easy to copy and put on a Web site. Since the Web has documents on line that are reaching billions of pages it is extremely hard for a publisher to track down sites which have infringed on an author's copyright by posting copies of the author's original work. An article entitled "Extent of copyright infringement on the Web" in the September 14, 1999 issue of Fortune Investor News, details the extent of copyright violations on the Web. "There are more than 2 million web sites offering, linking or referencing "warez," the Internet code word for illegal copies of software. This problem has increased significantly over the past three years, from roughly 100,000 warez sites two years ago, to 900,000 last year."

Generally, in the past, utilizing a search engine service to detect copyright infringement would suffice.

Keywords would be entered into a search engine, which indexes a large portion of the Web, to determine candidate pages to search for copyright infringement. Typically hundreds, if not thousands of hits would be returned to the search engine based on the search criteria using keywords.

The candidate pages were then downloaded to the author or publisher's computer. The searcher would then perform more computer aided processing on the candidate pages to determine potential infringers. If there were just a few pages, reading the downloaded files would be the next step to determine if there were any infringement. However, there would be many files to inspect and this would require a further search that involved more complex pattern matching. This step would narrow the choices further so that visual inspection of the files could be made to see if a copyright was being violated.

Unfortunately, the passage of The Digital Millennium Copyright Act, signed into law on October 28, 1998. has made the approach as described above untenable. The digital age has prompted the passage of strict laws on copyright protection by the United States Congress. A strict interpretation of the law would prevent anyone but exempted entities, from storing copies of copyrighted Web documents on their computer except for downloading incidental to viewing (caching and immediate viewing). While the law is complex the only clear exemptions are: Internet Service Providers (ISPs); search engines - as long as they do not profit directly; non-profit educational institutions and system caching.

Generally a publisher is not concerned about the

copying of a line or two of text or a few bars of music because that is not a violation of the "fair-use" act for copying. What he is most concerned about is the copying of entire paragraphs or sections of music verbatim. Even if data could be downloaded "legally" to disk, typical pattern matching algorithms take an inordinate amount of time when the matching strings that are very long (e.g., a text paragraph).

Due to the billions of Web pages on the Internet, and The Digital Millennium Copyright Act, the process of detecting unauthorized posting or copyright infringement on the Web becomes nearly impossible. Therefore it would be desirable to provide a process that would enable an author or publisher to do a reasonably thorough search of the Internet for copyright infringers without violating The Digital Millennium Copyright Act. Further, it would be desirable to detect Web pages that have copied or modified copyright digital data on the Internet, without extracting and storing pages to store and further process.

SUMMARY OF THE INVENTION

It is therefore one object of the present invention to search the Internet for copyright infringing material.

5

It is another object of the present invention to review the bulk of potential infringing material automatically.

10

It is yet another object of the present invention to review the bulk of potential infringing material without violating current digital copyright laws.

The foregoing objects are achieved as is now described. Signature analysis of streamed download data narrows a list of likely candidates after a search engine search has been performed. "Streamed download" means that the data is brought byte by byte to the searcher's computer and then discarded. During the streaming process the subject data, in binary form, is parsed into segments and each segment is provided with a signature based on the content of the segment. The signatures of the individual segments are then compared to signatures of the material that may have been infringed. If there are no matches, the streamed download data is discarded. If there are enough matches of the signatures, the offending data is displayed for visual inspection. Only caching and display takes place if a potential infringing segment is discovered.

25

The above as well as additional objectives, features, and advantages of the present invention will become apparent in the following detailed written description.

30

BRIEF DESCRIPTION OF THE DRAWINGS

The novel features believed characteristic of the invention are set forth in the appended claims. The invention itself however, as well as a preferred mode of use, further objects and advantages thereof, will best be understood by reference to the following detailed description of an illustrative embodiment when read in conjunction with the accompanying drawings, wherein:

Figure 1 depicts a high-level block diagram of a system for detecting copyright violation on the Internet in which a preferred embodiment of the present invention may be implemented;

Figure 2 is a high-level block diagram of a system for processing and providing electronic signatures for original copyright material in accordance with a preferred embodiment of the present invention;

Figure 3A depicts a high-level block diagram of a system for detecting copyright infringing material in which a preferred embodiment of the present invention may be implemented;

Figure 3B is a high-level block diagram for providing electronic signatures for potentially infringing material for comparison to original copyright material in accordance with a preferred embodiment of the present invention;

Figure 4 depicts a method for detecting material on the Internet that infringes copyrights in accordance with a preferred embodiment of the present invention;

5 **Figure 6** depicts a method of generating a signature for
a data segment in accordance with a preferred embodiment of
the present invention.

Fort Worth/0116AD-37542/78455.1

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENT

With reference now to the figures, and in particular with reference to **Figure 1**, a high-level block diagram of a system for detecting copyright violation on the Internet in which a preferred embodiment of the present invention may be implemented, is depicted. System **100** comprises server (or computer) **102** containing copyright material **104**, search engine **106** (whose program may be resident on a server connected to the web or computer **102**), Internet **108**, multiple web pages **110**, **112**, and **114** and comparator **116**.

In order for an author or publisher to detect copyright violators on the Internet the copyright material must be available for comparison. In the present invention copyright material **104** is available on server **102**. The author provides keywords, critical to copyright material **104**, to search engine **106** in a query to search for potential infringers. Search engine **106**, which may be located on server **102** or Internet **108**, then searches its own database of Universal Resource Locator (URL) addresses and Internet **108**, for web pages that contain the keywords.

Web page 1 **110**, Web page 2 **112** through Web page n **114** are returned in the form of URLs to server **102**. Signatures are generated from Web documents pointed to by each URL. These signatures are compared with known signatures of copyright material **104** through a comparator **116** to determine if there are any potential matches based on the occurrences of keywords. Web page comparator **116** to determine if there are any potential matches based on the number of keyword occurrences.

Referring to **Figure 2**, a high-level block diagram of a system for processing and providing electronic signatures for original copyright material in accordance with a preferred embodiment of the present invention is illustrated. Original copyright material **200** is parsed into data segments and converted to binary form. The converted data segments are then processed through signature generator **202** and corresponding electronic signatures **204** are generated. The signatures are stored to be utilized later for comparison with electronic signatures of potential infringing material.

Referring now to **Figure 3A**, a high-level block diagram of a system for detecting copyright infringing material in which a preferred embodiment of the present invention may be implemented is depicted. Computer **300** (a computer associated with the author or publisher of copyrighted material) is connected to Internet **302**. Search engine **304** may be resident on computer **300** or a separate server that is also connected to Internet **302**. Either search engine may be utilized to perform a keyword search for possible infringing copyright material on the Internet. If potential infringing material is found on server **306**, search engine **304** returns the URL of infringing server **306** and any other URL upon which potential infringing material is found. The material is parsed and provided with electronic signatures for comparison to the copyright material present on computer **300**.

Referring to **Figure 3B**, a high-level block diagram for providing electronic signatures for potentially infringing material in accordance with a preferred embodiment of the present invention, is depicted. Internet Web page **310**, in

this instance, has been determined to have potential infringing material on the web site. The URL of Internet web page **310** is returned to the site requesting the search. All URLs are then searched automatically. Signatures **312** for each data segment of the potential offending material from each URL are generated.

Signatures **312** are sent to comparator **314** as are signatures **316** of the original copyrighted material. Comparisons are made of the signatures, not the material itself, of both original and potential infringing material and any matches are returned to the searcher.

Referring now to **Figure 4**, a method for detecting material on the Internet that infringes copyrights in accordance with a preferred embodiment of the present invention, is illustrated. In this example of the method, a textual document will be used as an example. The process may be applied to audio, video graphic - any file or material that can be posted to a web site and converted into streaming data and provided with electronic signatures. The process begins with step **400**, which illustrates a searcher accessing the Internet. The process proceeds to step **402**, which depicts a search being performed utilizing keywords that are critical to identifying potential infringing material. The search engine may be accessed on the searcher's computer or a search engine connected to the Internet. The process passes to step **404**, which illustrates a determination of whether a file contains possible infringing documents. If enough keywords with enough frequency are found, a document is considered a potential infringing document. If there is no document found on the web site that contains enough instances of the keywords, the

process passes to step **405**. If there are documents found on the site that contain enough instances of the keywords, the process passes instead to step **406**, which depicts the search engine providing a list of links to potential infringing documents.

The process next proceeds to step **408**, which illustrates accessing one of the links on the list and beginning to process the referenced document. In this instance, the textual data is set for streaming to random access memory on the computer that is searching for the material. The process then passes to step **410**, which illustrates parsing the textual data into segments. Next, the process moves to step **412**, which depicts converting the parsed streaming data into a binary stream. The process then proceeds to step **414**, which illustrates utilizing the binary data to provide an electronic signature for each segment. The process continues to step **416**, which depicts signatures of the potentially infringing material being sent to a comparator for comparison to electronic signatures of the original, copyrighted material.

The process passes to step **418**, which illustrates a determination of whether all the segment signatures of the offending material match all the segment signatures of the original material. If the determination is made that all signatures match, the process proceeds instead to step **420**, which depicts loading the offending document to a visual display and visual inspection taking place. If the determination is made that all segment signatures do not match, the process continues to step **422**, which illustrates a determination of whether any signatures match. If it is determined that no signatures match, the process then passes

to step **428**, which depicts discarding the download and moving to another link. If the process determines that there are electronic signatures of the offending material that match (paragraphs are each assigned a signature, so that means at least a paragraph is exactly the same) the process proceeds from **422** to step **424**, which illustrates electronically marking the data segments that match. The process continues to step **426**, which depicts the marked data segments being presented for visual inspection and confirmation.

Referring to **Figure 5**, a device for providing signature analysis in accordance with a preferred embodiment of the present invention, is illustrated. A 16-bit linear feedback shift register that can be implemented in hardware or software for generating electronic signatures is used to compress a bit stream into a 16-bit unique signature. A signature is generated for each data segment or, in the case of text documents, paragraphs. The incoming bit stream from the original document is processed and signatures for the data segments are generated. Accuracy is important and a sixteen stage shift register detects a multi-bit error in a data stream with a probability of 99.998% and a single bit error with a probability of 100%. Signature analysis may be implemented in hardware or software and there are various techniques for signature analysis which may be substituted.

Referring next to **Figure 6**, a method of generating a signature for a data segment in accordance with a preferred embodiment of the present invention, is illustrated. An example of a portion of an HTML file is shown below:

<P>The Java 2D API enhances the graphics, text and imaging capabilities of the AWT, enabling the development of

richer user interfaces and new types of Java applications. Along with these richer graphics, font and image APIs,

the Java 2D API supports enhanced color definition and composition, hit detection on arbitrary geometric shapes and text, and a uniform rendering model for printers and display drivers.</P>

The beginning of a paragraph (data segment) is marked by a "<P>" and the end of the paragraph is marked by "</P>". The above HTML paragraph is converted to binary form and will be seen as an incoming data stream from the Internet. The process begins with step 600, which depicts receiving a data stream from the Internet. The process of detecting copyright infringement is in progress and signature generation for the incoming data stream is commencing. The process proceeds to step 602, which illustrates a determination of whether an ON signal should be sent to the tag counter. As shown above, a <P> marker in HTML indicates the beginning of a paragraph (data segment) and when <P>, the paragraph beginning marker, is noted in the data stream, the process moves to step 603, which depicts an ON signal being sent to the Tag counter. If the determination is made that no beginning marker is detected, the process continues from step 602 to step 606, which illustrates a determination of whether an end marker, or end of tag, has been detected. If the determination is made that an end of tag has not been received, the process passes to step 608, which depicts the signature analyzer processing the data stream. If the determination is made that an end of tag bit is received,

the process proceeds instead to step **607**, which illustrates sending an OFF signal to the tag counter.

5 The process then continues to step **604**, which depicts the tag counter receiving the end of tag signal. The process then passes to step **609**, which illustrates a determination of whether the tag counter has received an OFF signal. If the determination is made that the tag counter has not received an off signal, the process passes to step
10 **604**, and continues to wait for an end of tag signal. If the determination is made the tag counter has received an OFF signal, the process passes instead to step **610**, which depicts generating a signature of the data stream between the beginning and end of tag markers. The process then proceeds to step **612**, which illustrates the system storing the signature for comparison to original, copyright material electronic signatures.

25 The present invention is faster than existing techniques and reduces the need for human intervention. Pages don't have to be saved - data is streamed and matching is done utilizing a one pass pattern matcher. Copyright infringement detection is made more deliberate and easier to accomplish. The use of signature matching rather than
30 comparing infringing to original material allows for the automatic comparison of many questionable files in a short period of time which saves computing power and human intervention. Additionally, the detection is accomplished without infringing on the copyright of material that may not infringe. The present invention may be implemented in hardware as well as software.

It is important to note that while the present

invention has been described in the context of a fully functional data processing system and/or network, those skilled in the art will appreciate that the mechanism of the present invention is capable of being distributed in the form of a computer usable medium of instructions in a variety of forms, and that the present invention applies equally regardless of the particular type of signal bearing medium used to actually carry out the distribution.

Examples of computer usable mediums include: nonvolatile, hard-coded type mediums such as read only memories (ROMs) or erasable, electrically programmable read only memories (EEPROMs), recordable type mediums such as floppy disks, hard disk drives and CD-ROMs, and transmission type mediums such as digital and analog communication links.

While the invention has been particularly shown and described with reference to a preferred embodiment, it will be understood by those skilled in the art that various changes in form and detail may be made therein without departing from the spirit and scope of the invention.

CLAIMS:

What is claimed is:

1. A method for detecting copyright violation, comprising the following steps:
 - receiving streamed data segments of suspected copyright infringing material;
 - generating an electronic signature for each said data segment of said suspected material; and
 - comparing each said signature for each said data segment of said suspected material to electronic signatures of original copyright material.
2. The method of Claim 1, further comprising:
 - extracting streamed data from the Web onto a server connected to the Internet; and
 - converting said streamed data to a binary stream.
3. The method of Claim 2, further comprising:
 - parsing said streamed data into data segments; and
 - generating a signature for each said streamed data segment.
4. The method of Claim 1, further comprising:
 - parsing original copyright material into data segments;and
 - generating an electronic signature for each said copyright data segment.
5. The method of Claim 1, further comprising:
 - performing signature analysis on said streamed data segments; and
 - visually examining said data segments matching any said

5 copyright data segments.

1 6. The method of Claim 1, further comprising:
2 providing key data critical to recognizing said
3 copyright material for searching the Internet for infringing
4 copyright material.

1 7. A system for detecting copyright violation, comprising:
2 receiving means for receiving streamed data of
3 suspected copyright infringing material;
4 signature generation means for generating electronic
5 signatures of said suspected material; and
6 comparator means for comparing each said signature for
7 each said data segment of said suspected material to
8 electronic signatures of original copyright material.

1 8. The system of Claim 7, further comprising:
2 extraction means for extracting streamed data from the
3 Internet onto a server connected to the Internet; and
4 binary conversion means for converting said streamed
5 data to a binary stream.

1 9. The system of Claim 8, further comprising:
2 parsing means for parsing said streamed data into data
3 segments; and
4 means for generating a signature for each said streamed
5 data segment.

1 10. The system of Claim 7, further comprising:
2 parsing means for parsing original copyright material
3 into data segments; and
4 means for generating an electronic signature for each
5 said copyright data segment.

1 11. The system of Claim 7, further comprising:
2 comparison means for performing signature analysis on
3 said streamed data segments; and
4 means for displaying and examining said suspected data
5 segments matching any said copyright data segments if
6 matching signatures exceed a predetermined number.

1 12. The system of Claim 7, further comprising:
2 key data critical to recognizing said copyright
3 material for searching the Internet for infringing copyright
4 material.

12. The system of Claim 7, further comprising:
key data critical to recognizing said copyright
material for searching the Internet for infringing copyright
material.

1 13. A system for detecting copyright violation, comprising:
2 a server connected to the Internet for storing
3 copyright material;
4 a search engine available to said server for searching
5 the Internet;
6 receiving means on said server for receiving streamed
7 data of suspected copyright infringing material;
8 signature generation means for generating electronic
9 signatures of said suspected material; and
10 comparator means for comparing each said signature for
11 each said data segment of said suspected material to
12 electronic signatures of original copyright material.

14. The system of Claim 13, further comprising:
means for loading said copyright material onto said
server for comparison to infringing copyright material.

15. The system of Claim 13, further comprising:
data critical to said copyright material for searching
the Internet for infringing copyright material.

16. The system of Claim 13, further comprising:
data streaming means for streaming suspected infringing
data files from locations on the Internet.

17. The system of Claim 13, further comprising:
conversion means for converting said streaming data to
a binary stream.

1 18. A computer program product within a computer readable
2 medium having instructions for detecting copyright
3 violation, comprising:

4 instructions within said computer readable medium for
5 receiving streamed data of suspected copyright infringing
6 material;

7 instructions within said computer readable medium for
8 generating electronic signatures of said suspected material;
9 and

10 instructions within said computer readable medium for
11 comparing each said signature for each said data segment of
12 said suspected material to electronic signatures of original
13 copyright material.

14 19. The computer program product of Claim 18, further
15 comprising:

16 instructions within said computer readable medium for
17 extracting streamed data from the Web onto a server
18 connected to the Internet; and

19 instructions within said computer readable medium for
20 converting said streamed data to a binary stream.

21 20. The computer program product of Claim 19, further
22 comprising:

23 instructions within said computer readable medium for
24 parsing said streamed data into data segments; and

25 instructions within said computer readable medium for
26 generating a signature for each said streamed data segment.

27 21. The computer program product of Claim 18, further
28 comprising:

29 instructions within said computer readable medium for
30 parsing original copyright material into data segments; and

5 instructions within said computer readable medium for
6 generating an electronic signature for each said copyright
7 data segment.

1 22. The computer program product of Claim 18, further
2 comprising:

3 instructions within said computer readable medium for
4 performing signature analysis on said streamed data
5 segments; and

6 instructions within said computer readable medium for
7 visually examining said data segments matching any said
8 copyright data segments.

23. The computer program product of Claim 18, further
comprising:

instructions within said computer readable medium for
providing key data critical to recognizing said copyright
material for searching the Internet for infringing copyright
material..

DETECTING COPYRIGHT VIOLATION VIA STREAMED EXTRACTION AND
SIGNATURE ANALYSIS IN A METHOD, SYSTEM AND PROGRAM
ABSTRACT OF THE DISCLOSURE

Signature analysis of streamed download data narrows a
5 list of likely candidates after a search engine search has
been performed. "Streamed download" means that the data is
brought byte by byte to the searcher's computer and then
discarded. During the streaming process the subject data,
in binary form, is parsed into segments and each segment is
10 provided with a signature based on the content of the
segment. The signatures of the individual segments are then
compared to signatures of the material that may have been
infringed. If there are no matches, the streamed download
data is discarded. If there are enough matches of the
signatures, the offending data is displayed for visual
inspection. Only caching and display takes place if a
potential infringing segment is discovered.
